### Introduction

Insecticide Toxaphene and similar products have been produced for many decades by chlorinating terpenic precursors, mainly camphene or pinene. The most effective insecticides contained 65-69 % of chlorine, which corresponds to hepta- to octachloroterpenes<sup>1</sup>. However, hexachloro- and nonachlorocongeners are also present in technical products. Regarding terpene type, chlorinated bornanes are the main part, chlorinated bornenes, bornadienes, camphenes and dihydrocamphenes have been also detected or postulated in technical insecticide or environmental samples<sup>2-4</sup>. Recently a tricyclic compound has been reported<sup>5</sup>. For many years our laboratory has been involved in isolation and structure elucidation of chlorinated terpenes – potential components of insecticide Toxaphene<sup>2-12</sup>. The present report is a brief summary of our effort and a reference on GC relative retention times for 122 chloroterpenes, synthesized in our lab.

### Materials and Methods

Chlorinated terpenes were prepared by free-radical chlorination of 2,10-Dichlorobornane, 2,10,10-Trichlorobornane or 2,10-Dichlorocamphene to a desired extent, followed by fractionation on silica gel with hexane as eluent<sup>3,4,7,12</sup>. As a rule, several successive crystallizations from different solvents were a way to final purification. A number of congeners have been then modified via chlorination, dechlorination or dehydrochlorination to yield further compounds. Relative retention times were determined against 2,2,5,5,8,9,9,10,10-Nonachlorobornane (Parlar no. 62)<sup>7-9</sup>.

The isolated compounds are listed in Table 1. The structures and numbering system of parent compounds are given below:

# **ANALYSIS II -POSTER**

## **Summary**

To date 122 congeners can be considered as isolated and characterized. Accumulated information on the structure - property correlations for polychloroterpenes, in combination with selective synthetic methods makes preparation of a congener of a given structure easily (relatively speaking) possible.

## **Acknowledgements**

We would like to thank Promochem GmbH, Wesel, Germany for their support of our research. This work was supported in part by INTAS grant 96-1990.
